MISSION OF THE WINIFRED MASTERTON BURKE MEDICAL RESEARCH INSTITUTE

Neurological diseases including stroke, spinal cord injury, traumatic brain injury, Alzheimer's disease and Parkinson's disease are leading causes of disability in the United States. Indeed, as modern medicine has found remarkable ways to keep patients alive who are afflicted with neurological conditions, the burden of disability has grown. One of the overarching goals of the Burke Medical Research Institute is to utilize the best in contemporary neuroscience to optimize quality of life in patients with neurological disability. We are actively making progress toward this goal by using “lab bench to bedside” and “bedside to lab bench” strategies that optimally synergize efforts of scientists, clinician-scientists and clinicians at the Burke Rehabilitation Center.
