

## Imagine making **AN IMPACT**

Consider taking part in a clinical trial that is currently enrolling to treat early stage Alzheimer's disease.

Are you or someone you know experiencing memory loss? Are you or someone you know having trouble retaining information? This may be an indication of early stage Alzheimer's disease, which is a type of dementia that causes problems with an individual's memory, thinking, and behavior.

### What is the Cognite Trial?

The Cognite Alzheimer's Clinical Trial is enrolling men and women who have signs of early stage Alzheimer's disease. The clinical trial is evaluating whether an investigational combined treatment slows down, arrests, or reverses early stage Alzheimer's disease.

Compensation for time and travel may be available for eligible participants and their study partners.

### What are the criteria to participate?

#### To qualify, participants must:

- Be between 55 and 79 years old
- Have at least 8 years of education
- Have noticed changes in their memory, or have been told by a loved one that they are concerned about their memory problems
- Have noticed changes in their normal, everyday behavior
- Attend all study visits with a study partner with whom the participant has frequent contact
- Be in good general health
